ThinKloud interview task

Greetings from ThinKloud ,

   As a part of our recruitment process we require to examine the cardinaite with a task that it doesn't measure his understanding of the technology but it meant to test his/her knowledge curve. So we just need to see the best of you.

Best wishes

PhoneBook

   Create a phone book app using **LoopBack** (Node.js API Framework) and Angular 4+ . the application should allow the user to create , update ,delete phone book records and search recorder by name. The phone book record contains the **name** , **phone number.** The name should be at least 3 chars and phone number is unique

   Using **LoopBack** is really street forword just use the command line (*see it here*). In the client side use your imagination to build a UI the suites the application requirement don't worry we don't require that to be polished just make it as simple as possible

In case if you had an issues with CORS try to follow the link below
https://github.com/angular/angular-cli/blob/master/docs/documentation/stories/proxy.md
